

# Electrostatic Painting

## We're Charged Up!

Electrostatic painting uses the principle of "opposites attract" to create a drip free, uniform and durable finish on metal. The wrap-around effect results from a force field between the negatively charged paint particles and the grounded work piece. The result is a flawless paint job without the drips and bubbles that can occur with traditional liquid paints. Both the front and rear of the work piece are coated at the same time, saving you time and money. It's much more durable than liquid paint and it's an environmentally friendly process because there are no solvents to evaporate into the air or go down the drain. A range of thousands of color glosses, metallics and antique effects are available. We can make any metal fixture match your already existing furniture or surroundings.

Here are some of the ways in which Jack Laurie Interiors Contracting can help you with your electrostatic painting needs:

### Office Buildings and Health Care Facilities

- Filing cabinets and office furniture
- Restroom stalls
- Door and window frames
- Elevators and staircases
- Air handling units
- Lab hoods and cabinets

### Grocery and Retail

- Refrigeration cases and displays
- Checkout counters

### Schools and Fitness

- School hall lockers
- Athletic lockers and benches

### Outdoor

- Chain link fencing
- Wrought iron, railing and stairs
- Door and window mullions
- Utility compounds and rooftop HVAC
- Parking structures and light poles
